2026

April Book Spotlight One:

Settling the Solar System

This book shows what the Solar System might look like in a couple of hundred years after it has been visited and settled by man.

We start with the most inward planet—Mercury, and move out to the other planets and some moons in sequence.

These AI pictures show bases, space stations, rockets, research establishments, and other infrastructures which might exist then around our Solar System.

Future infrastructure needs will include many space based industries and lots of Space Colonies. Several options for these are shown.

I used the Chat GPT AI tool and the images module to create all of these images. By just putting in some detailed text describing the image desired new images are created. Additional text can be used to optimize the image like improving brightness or removing an object from the background.
